## **Suicide Data**

- Suicide correlations to opioid addictions, rates of violent crime, smartphones/social media, remote work/job type could make interesting comparisons in addition to other planned comparisons
- Look for COVID data if any exists - could be a story layer?

## **Design Decisions**

- Why separate the button panel and the data filters?
  - Some apply only to map, some apply universally
- How to overlay suicide data with other data for the graph?
  - Two line graphs with different y-scales on top of one another
  - Makes sense with one country
    - Maybe harder with multiple countries
- Will prefer the larger map design with the map as an almost full page
  - Smaller design feels slightly clunky
  - Larger map and graph makes the visual aspect of the project more apparent
  - Use dropdowns to make the nonvisual aspects smaller and less focused
    - Takes up less space
    - Can have base level descriptors of what each dropdown option does
  - To make scrolling down intuitive give information at the top for the options to change the map and the graph
- Add storytelling
  - Subset of data that seems interesting

## **Quality of the feedback**

The feedback from the reviewers is great. The reviewers were resourceful and quickly pointed out the issues we had in our UI. From their viewpoint they pointed out the issues and explained how it will be done in a more intuitive way. Overall the quality of their feedback is very helpful towards our design.

## **How we will address the feedback**

The reviewers have made us review our design decisions. While we probably won't change our design to be exactly what they suggested, we plan on taking their feedback about larger visual

aspects into account in our redesign. We also feel that the feedback about separating the two interactive sets of buttons is relevant and are taking into account that they should be in a similar location even if they have slightly different purposes. For storytelling, we are looking at finding interesting data comparisons between suicides and things like smartphone usage.
